lst strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and Ecok V sites of the pCMVSPORT 6 vector. Library
was normalized. Library was constructed by Life Technologies, a
division of Invitrogen. This sequence belongs to sequence cluster
                                                                                                                                                          1398

The invention relates to a novel method for harvesting a (poly)peptide produced by a recombinant host cell. The novel method involves selecting a cell comprising a first nucleic acid encoding a leader peptide and a second nucleic acid fragment encoding the desired (poly)peptide. The first and second fragments are within the same open reading frame of the first nucleic acid and the leader peptide is functionally equivalent to The host cells and nucleic acids are useful for producing, harvesting and post-translational modification of polypeptides. The polypeptides may be used in the production of pharmaceuticals, e.g. as antigen for vaccine or immunogenic composition. This sequence represents a polypeptide relating to the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                         242

      Nucleic acid comprising a sequence encoding amino acids 14-414 of streptokinase, which binds to plasminogen and does not have a sequence comprising amino acids 60-414 is new. The polypeptide pref. comprises amino acids 244-352, 1-352, 120-352 or 244-414. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)

1322 1202 1262 340 360 induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a GAAAAGCCGTATGATCCCTTTGATCGCAGTCACTTGAAACTGTTCACCATCAAATACGTT GATGTCGATACCAACGAATTGCTAAAAAGTGAGCAGCTCTTAACAGCGTAGCGAACGTAAC AspValAspThrAsnGluLeuLeuLeuLysSerGluGlnLeuLeuThrAlaSerGluArgAsn TTAGACTTCAGAGATTTATACGATCCTCGTGATAAGGCTAAACTACTACTACAATCTC GATGCTTTTGGTATTATGGACTATACCTTTAACTGGAAAAGTAGAGGATAATCACGATGAC Streptococcus; streptokinase; fibrin-dependent plasminogen activator; nSK; zSK; bacterial; blood clot; thrombotic condition; myocardial infarction; venous thrombosis; pulmonary embolism; cerebral thrombosis; graft thrombosis; arterial thrombosis. present invention describes an isolated bacterial protein that Streptococcus equisimilis native streptokinase. Streptococcus dysgalactiae subsp. equisimilis.

```
bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infaction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial althrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a degradation of fibr streptokinase at least one amino acid substitution that inactivates a degradation of the streptokinase at least two-fold. The present sequence represents native streptokinase at least two-fold. The present sequence standardise OS field)

                   The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro58-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence represents native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPIg) to hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                         80
and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epptiope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. Pl is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever. (Updated on 17-OCT-2003 to standardise OS field)

and Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibronectin. This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, fibrin binding regions of human fibronectin, which are from fibrin binding of mains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a ; > Sundaram Nihalani D,

pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG: The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of aardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 12-SSP-2003 to standardise OS field)

composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a daministering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaccutical composition comprising a blood clots in patients with a thrombosi condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a streptokinase at least two-fold. The present sequence represents a streptokinase at least two-fold. The present sequence represents a streptokinase and maltose binding protein fusion protein

```
Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical equipment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the wild type plasminogen-binding fragment of streptokinase. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower
                                                                                                                                                                                                                                                                                                    361 ThrasnargileileThrValTyrMetGlyLysArgProGluGlyGluAsnalaSerTyr

                                             The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProS8-Lys55-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen

```
Modified forms of streptokinase resistant to enzymatic cleavage - useful as thrombolytic agents in treating thrombosis and in medical equipment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a fusion protein between maltose-binding prote and the plasminogen-binding fragment of srreptokinase. This fusion protein was used in the design of modified streptokinase has an in vitr degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in
                                                                                                                                                                                                                                                                                                                                                               AspalaPheGlyIleMetAspTyrThrLeuThrGlyLysValGluAspAsnHisAspAsp

The invention relates to a method for identifying and quantifying one or more proteins in complex mixtures by selectively isolating peptides not containing histidine nor arginine (NRNR peptides) from each protein, and determining the relative concentration of one or more proteins in different samples from the ratio between the areas of estimated theoretical spectra for each NRNR peptide labeled with different isotopes in each sample. The method comprises: (a) enzymatically or chemically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying and quantifying proteins in complex mixtures by selectively isolating peptides not containing histidine nor arginine from each protein, and determining the relative concentration of proteins in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 d
```

```
hydrolyzing the sample or samples of proteins; (b) chemically modifying alpha and epsilon amino groups (alpha- and epsilon-NH2) of every peptide obtained in step (a); (c) isolating the NRNR peptides by cation exchange chromatography from the mixture of peptides obtained in step (b); (d) identifying proteins by mass spectrometry analysis of the NHNR peptides obtained in step (c); (e) differential isotopic labeling of proteins camples previously to step (a) or during steps (a) or (b) and immediately mixing at least a portion of the samples; and (f) relative quantifying of mixing at least a portion of the samples; and (f) relative quantifying of areas of estimated theoretical spectra of the pair of NHNR peptides identified in step (d), as well as from the ratio between the areas of the estimated theoretical spectra of fragments from the NHNR peptides. Generated in step (d). Also described is a kit for the identification and quantification of proteins in complex mixtures, which comprises the method and kit are useful for identifying or diagnostic uses, in complex mixtures. The present sequence represents a streptorianse protein, which is used in an example from the present

Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of given species.

Example 6; Fig 28; 77pp; English.

proteins. The relations of machine and the analysin of sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate at reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein. (Updated on 17-OCT-2003 to standardise OS field) invention relates to a method for the production of non-immunogenic

Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes.

Example 2; Fig 5; 42pp; English

proteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for producing a protein with an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive daugs to its active form within a living organism, a vaccine, a protein used as a carrier of other molecules or a protein which binds to other molecules within or introduced within the living organism in order to alter the bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a therapeutic or a diagnostic agent. Streptokinase is produced by certain strains of beta-haemolytic agent. Streptokinase is produced by certain strains of beta-haemolytic considerable clinical importance owing to its ability to efficiently bind human plasminogen, potentiating its activation to plasmin and thereby consort thrombosis, improving survival and preserving left ventricular function following myocardial infarction. The new method colds Streptokinase is an effective thrombolytic agent in the treatment of consory thrombosis, improving survival and preserving left ventricular communogenic and the production of fleting antibodies in humans communogenic and the production of neutralising antibodies in humans proving a lower a lower of the wild type streptokinase. The new method could proving all infarctions of the wild type streptokinase. The altered streptokinase sequence is given in AAB01296. See GENESEQ records AAB01289-B01302. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2, An Sequence 3, An Sequence 16, An Sequence 16, An Sequence 19, An Sequence 43, An Sequence 44, An
